Application No. 10/570,616
Reply to Office Action of June 25, 2009 and
Notice of Non-Compliant Amendment of January 22, 2010

ABSTRACT

A method of exchanging content between a source device and a connected device based on a detected transfer mode. In a first mode, the source device retrieves data from a connected device and revokes the access right information corresponding to the content at the connected device. In a second mode, which is based on the detection of a group identification scheme included in the content, the content may be copied back and forth between the source device and the connected device without any revocation of access rights.
